

B Recursive investigation separates corpus scale from per-call context

1 Single-call prompt

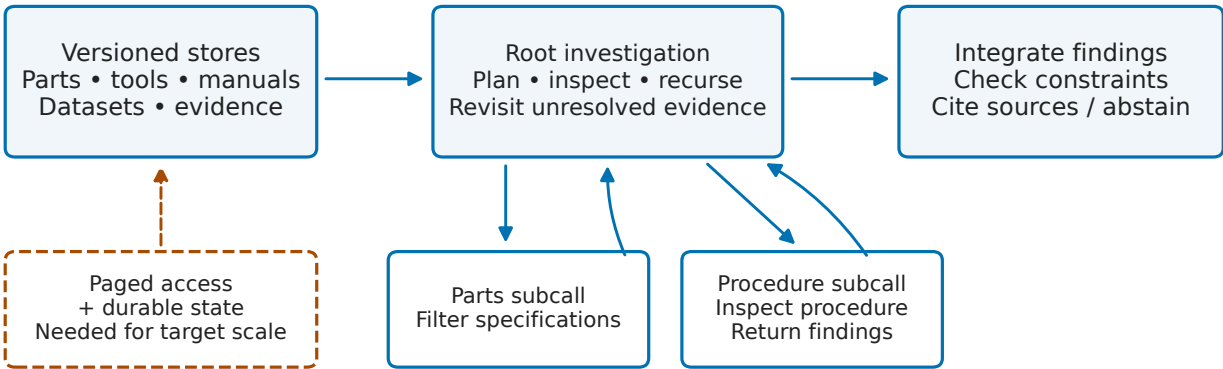

Only supplied evidence is visible in this call; selection must happen upstream.

2 Retrieval-based agent

Also accesses corpora larger than a prompt and can iterate across turns.

3 REA recursive investigation

Every model call remains bounded. Selective access does not imply reading every record.

Current REA materializes a bounded corpus in RAM. 60M-part operation is a design target.
